AI that works: build your assistant

0. Install

Go to **claude.com/code**, pick your computer, follow the steps. Then type `claude` and sign in.

1. A home

Folder on your Desktop called `assistant`. Open a terminal there. Type `claude`.

> *What can you do on this computer?*

> *Make two folders here: projects and out.*

2. Memory

> *Create CLAUDE.md in this folder. Who I am: ___. My work: every week I ___. How I like things: short answers, plain language, ask before anything big. Rules: only work inside this folder, save what you make to `out`, ask before deleting. When I say "remember", add it here.*

Quit (`/exit`), start `claude` again, ask what it knows about you.

3. Real work

Drag a **copy** of a real file in. Pick one. Say: **"Make a folder in projects for this job, move my file there, then:"**

- **Video** (30 s from your phone): cut the dead air, add captions, export for LinkedIn.
- **Meeting notes:** summary, decisions, action items with owner and date, follow-up email.
- **Any CSV:** one-page weekly report as a PDF, two charts, the three numbers that changed most.
- **Receipts:** one expense report: date, shop, what, total, VAT. Total at the bottom.
- **Blog post:** a LinkedIn post, three tweets and a newsletter blurb, in my voice.
- **Contract PDF:** plain-language summary, what I'm committing to, anything risky.
- **Research:** compare ___, ___ and ___: a table and a one-page PDF with sources.

Say what to change. When it's right: **"remember that."** No file? Practice kit: github.com/prasann16/ai-that-works-workshop

4. A skill

> *Turn what we just did into a skill called ___.*

> *Run the ___ skill on `___`.*

5. A heartbeat

> *Every weekday at 8am, write me a note in out/today.md with what's new and the one thing I said I'd do.*

6. Your pocket

Telegram → @BotFather → `/newbot` → copy the code. Then in Claude Code:

`/plugin install telegram@claude-plugins-official` · `/telegram:configure <code>` · restart with `claude --channels plugin:telegram@claude-plugins-official` · text your bot, pair with `/telegram:access pair <6 letters>`.

(Needs Bun, from **bun.sh**. No Bun? Claude app → Remote Control.)

Always-on, lid closed, voice notes: `curl -fsSL https://kencomputer.dev/install | bash`

Rules: copies not originals · read before you click yes · never paste a password · one folder per job · `Esc` stops it.
